

My PC is a few years old and getting quite slow. What can be done to speed it up?

A PC a few years old will often slow down. This is not due to a physical deterioration of the machine but usually do to the updates automatically downloaded and installed on the machine and additional software that has been installed.

There are many ways of resolving this issue, from adding addition physical memory (RAM which is releatively cheap) or just performing and good spring clean on your systems data.

If you are unsure of how to go about this then contact us at Xpress Concepts and we will be able to discuss with you the most appropriate action for your machine.
